

TECHNICAL PROCUREMENT, SUPPLY PLANNING AND ERP

I connect purchasing decisions, material plans and ERP data to keep production ready.

I spot supply risks early and make sure the right action is followed through before production is affected.

I look beyond the purchase order: delivery, cost, quality, data accuracy, documentation and the effect on production. I make sure the next action is clear and followed through.

2,000+

ERP and master-data records

200+

complex product/BOM structures

30+

international suppliers

100+

items with conflicting cost and sales-price data

THREE WORKING PRINCIPLES

01**I keep the whole flow visible.**

I connect supplier timing, material status, ERP data, quality evidence and production priorities so problems are easier to see before they become disruptions.

02**Careful is not a system.**

Being careful is not enough. I want to know which information we trust, who owns the decision and how we make sure the issue is followed through.

03**I do not start with the tool.**

I start with the problem. If technology makes the work clearer, faster or more reliable, it has a purpose; otherwise I keep the process simple.

SIGNATURE VALUE

Spot operational risk early, make missing information and ownership visible, and follow actions through to closure.

CORE CASE 01

Keeping an approved change aligned before first production.

A sanitised reconstruction of how customer or engineering changes affected ERP, materials, suppliers, documentation and production readiness.

FROM CHANGE TO CONTROLLED HANDOVER

01

Input

Approved customer, engineering or prototype change.

02

Impact

BOM/route, MRP, material, treatment/test, supplier and document effects.

03

Update

Controlled AX/D365 and readiness actions.

04

Validate

Coverage, FAI, traceability, approvals and open risk.

05

Handover

Production-ready records and named next actions.

MY CONTRIBUTION

Turn the change into action

Converted approved input into ERP, material, supplier, documentation and production-readiness actions.

Check the full impact

Checked BOM/routing readiness with MRP, stock/incoming supply, shortages, phase-in/out, supplier timing, treatment/test requirements and documents.

Keep ownership clear

Kept decision responsibilities, approvals, dates, open risks and next actions visible across functions.

Protect first production

Followed first-article, traceability and unresolved issues before production or release.

CASE AT A GLANCE

Context

High-mix technical manufacturing with prototypes, revised parts and controlled customer requirements.

My role

ERP, master-data, material and production-readiness coordination within approved authority boundaries.

People involved

Engineering, Quality, Planning, Purchasing, Production, Warehouse and suppliers.

Systems

Dynamics AX/D365, Excel and controlled technical documentation.

DOCUMENTED OUTCOME

Created or validated 200+ complex structures in about two weeks while preserving traceability and keeping approved changes, materials and open actions aligned before execution.

CORE CASE 02

Supplier performance, risk and terms in one clear decision view.

A sanitised reconstruction of documented technical purchasing across materials, customer-specific components, surface treatments, specialist subcontracting, external testing/inspection, RFQs, supplier decisions and follow-up across 30+ suppliers.

HOW I APPROACHED THE DECISION

01

Collect

Supplier, commercial, delivery, inventory and capacity inputs.

02

Check

Source date, owner, units, completeness and confidentiality.

03

Compare

Price, capability, lead time, risk, alternatives and impact.

04

Recommend

Options, trade-offs, who decides and required approval.

05

Follow up

Decision log, supplier action, due date and closure.

WHAT I BROUGHT TO THE DECISION

Broad technical purchasing

Bought across materials, customer-specific components, frequent surface-treatment orders, specialist subcontracting and external testing/inspection.

Delegated supplier ownership

Selected sourcing routes, introduced alternatives, reallocated requirements and concluded routine awards within delegated authority.

Risk behind the purchase order

Compared price, quantity, lead time, capability, capacity, quality, documentation and production impact.

Follow-through

Tracked confirmations, shortages, deviations, returns, corrective actions and recovery until closure or escalation.

CASE AT A GLANCE

Context

High-mix precision manufacturing with broad technical buying across materials, components and outsourced production/quality processes.

My role

Assigned supplier and technical-purchasing portfolios, RFQs, negotiation, routine awards, POs, alternatives and recovery.

People involved

Suppliers, Procurement, Engineering, Quality, Planning, Production, Warehouse and Finance.

Systems

Dynamics AX/D365, Excel, supplier records and controlled documentation.

DOCUMENTED OUTCOME

Caught conflicting cost and sales-price data affecting 100+ items before a major quotation and maintained structured follow-up across 30+ suppliers.

BOUNDARY

Routine sourcing and supplier decisions were handled within delegated authority. Exceptional, unusually high-value or high-risk commitments were checked with the responsible manager.

PROBLEM SOLVING AND PRACTICAL TECHNOLOGY

Understand the problem before choosing the tool.

HOW I APPROACH A RECURRING PROBLEM

When something keeps going wrong, I first work out whether we understand the real cause. I check the source information, what is affected and who needs to make the decision. Then I focus on a fix that people can actually use in day-to-day work.

Tools when they help: root-cause analysis, impact mapping, structured checks, reporting, automation and AI. The tool itself is never the point.

TECHNOLOGY IN PRACTICE

Technology can help with preparation and visibility, but it should support the work rather than become the work. The final decision stays with the responsible person.

HOW I START

01-30

Map the operation

Risks, sources, decision boundaries, owners and signals.

31-60

Stabilise

One exception view, work instruction or practical control.

61-90

Improve

One measurable change with a named owner and a clear review rhythm.

Next

Scale carefully

Only after people use the routine reliably; add automation or AI only where it clearly helps.

BEST-FIT ROLES

Technical Buyer / Tactical Buyer

Procurement Operations / Supplier Performance

ERP / Master Data / Configuration

Supply Planning / Production Readiness

Process Excellence / Quality Documentation

EARLIER COMMERCIAL OPERATIONS EXPERIENCE

Earlier French and European operations experience covered customer and order data, pricing, invoicing, payment follow-up, delivery coordination and issue resolution in NAV/Navision.

OPERATING ENVIRONMENTS

Defence/advanced manufacturing | FMCG: 5 lines / 40+ variants | Nordic WMS/distribution | SAP purchasing: 15-20 suppliers | ISO 9001/Lean.

CAREER PROGRESSION

Strong operational experience. A clear next step.

My next step is to take on wider supplier portfolios, more complex sourcing decisions and supplier development while staying close to day-to-day operations.

A PRACTICAL PROGRESSION PATH

01

What I handle today

Assigned supplier and broad technical-purchasing portfolios across materials, components and outsourced processes; sourcing routes, RFQs, negotiation, delegated awards, ERP data and production readiness.

02

What I am ready to take on next

Wider supplier portfolios, more complex sourcing decisions, supplier development and a stronger contribution to category work.

03

Where I want to grow

Toward broader category or procurement responsibility as I build more strategic ownership, measurable value and experience leading workstreams and supporting others.

LEADERSHIP IN PRACTICE

Delegated decisions

Handled routine sourcing and supplier decisions within delegated authority and escalated exceptional risk with evidence.

Cross-functional coordination

Worked across Procurement, Engineering, Quality, Planning, Production, Warehouse and 30+ suppliers to keep priorities, risks and next actions aligned.

Repeatable control

Used grouped setup and validation checks to create or validate 200+ complex structures in about two weeks.

Continuity under pressure

Maintained critical supply and production-readiness follow-up for about three weeks during reduced team coverage.

HOW I THINK ABOUT PROCUREMENT

Good procurement depends on reliable information and sound judgement.

I look beyond unit price, consider the real supply risk and keep the solution practical enough to work in day-to-day operations.

Technology can improve preparation and visibility, but accountability stays with the person making the decision.
